FieldBridge AI

Viva & Showcase - Defending the Problem, Solution, Deployment, Response and Proof

STUDENT	Manish Singh | 25PGDM149
PROGRAMME	PGDM Marketing, Batch 2025–27
ORGANISATION	Kantar Research India
ENGAGEMENT	CEEW Consumer Research - Solar Dryer Adoption

Concise Showcase Summary

What FieldBridge AI is, in one line

An AI-powered interview support tool that converts formal Hindi questionnaire language into simple, dialect-adapted Hindi for Research Associates in real time - the consumer never sees or interacts with it.

PROBLEM

Formal Hindi questions caused comprehension gaps in CEEW solar-dryer interviews

BUILT

Working prototype (FieldBridge_AI_Demo.html), powered by the Claude AI API

DEPLOYMENT

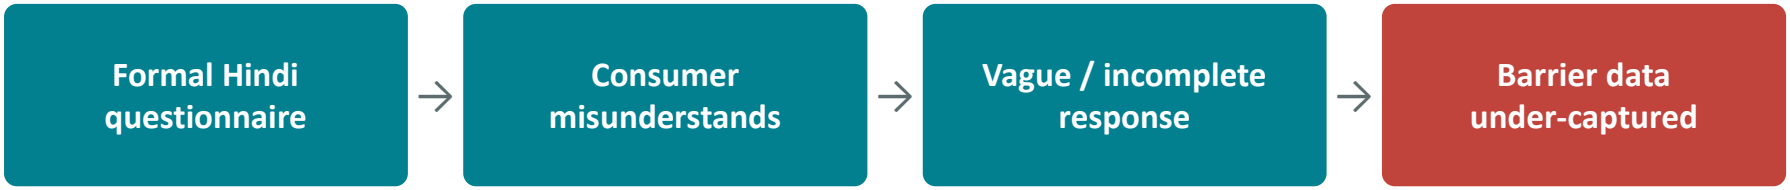

Level 1 - Demonstrated in Context, to organisational supervisor

STATUS

Student-built prototype; verbal supervisor interest, no written adoption yet

The Problem

Comprehension gap at the point of data collection

THE TRIGGER INCIDENT

Asked about financing options for the solar dryer, a respondent repeatedly answered a different question about product performance - requiring the interviewer to pause, simplify, and re-explain before a usable response could be recorded. This was not isolated; similar breakdowns recurred across interviews.

WHO IT AFFECTS

Research Associates carry the comprehension-bridging burden live, improvising inconsistently.

CEEW barrier identification and policy recommendations depend on response accuracy.

Consumers genuine adoption barriers get imprecisely or incompletely captured.

The Solution — Five Layers, One Interviewer Tool

FieldBridge_AI_Demo.html, powered by the Claude AI API - runs on the interviewer's tablet only

1. **Language Simplification**
   Formal questionnaire Hindi → simple conversational Hindi
2. **Dialect Adaptation**
   Regionally tailored phrasing for the respondent's state
3. **Term Explainer**
   Instant plain-language meaning of technical terms, on request
4. **Confidence Scoring**
   Flags each response Green / Yellow / Red in real time
5. **Follow-Up Suggestion**
   One targeted probe suggested on a Yellow or Red signal

HUMAN-IN-THE-LOOP

AI suggests.
Interviewer decides.

The AI never interacts with the respondent directly. Every output is visible only to the interviewer, who retains full authority over every question asked and every response recorded.

The Storyline

Problem → Solution → Proof → Organizational Response

PROBLEM	SOLUTION	PROOF	RESPONSE
1	2	3	4
Formal Hindi questionnaires caused systematic comprehension gaps in CEEW solar-dryer consumer interviews.	FieldBridge AI - a 5-layer, Human-in-the-Loop tool built on the Claude API to simplify questions for the interviewer only.	Live prototype demoed on real CEEW-style questions - e.g. the Q3 financing question rewritten from formal to conversational Hindi with a term explainer and follow-up probe.	Organisational Supervisor Mr. Utpal Singh confirmed the problem as genuine and saw value for training new Research Associates.

Deployment & Evidence

Level 1 — Demonstrated in Context

Level 1
Demonstrated in Context ✓
Achieved

Level 2
Team-Level Use

Level 3
Organizationally Adopted

HOW IT WAS DEMONSTRATED

- Demonstrated to Mr. Utpal Singh, Manager, Kantar India - via WhatsApp (screenshots) and a live call, ~15–20 minutes
- Two real CEEW-style formal Hindi questions used live: Acquisition section and Maintenance section
- Supervisor watched the tool generate simplified Hindi, term explanations, confidence guide, and follow-up probe in seconds

PROOF ITEMS ATTACHED

- FieldBridge_AI_Demo.html - working browser-based prototype
- Documented workflow - full system prompt + 3 real Q&A examples
- Supervisor confirmation - WhatsApp + call summary with direct quote

Level 2/3 not reached: fieldwork window had closed by the time the prototype was demonstrable, and Kantar's data-handling protocol requires IT sign-off before wider staff use — not initiated within the internship timeline.

Organizational Response

Mr. Utpal Singh — Manager, Kantar India (Organisational Supervisor)

> *The simplification approach looks useful because interviewers often need to explain difficult questions in their own words. A tool like this can help maintain consistency while improving respondent understanding.*

Problem confirmed

Genuine, commonly faced challenge for Research Associates in rural and semi-urban fieldwork

Value seen

Training new Research Associates and reducing interviewer-to-interviewer variation

Gaps flagged

Internet connectivity, regional language variation, integration with existing survey platform
